SIAGA.ID Map snapshot report - not an official warning

Figures computed by code

Captured 2026-11-05 01:09 WIB (UTC+7)
BBOX 93.4277,-9.1455 -> 142.5586,4.7845 ZOOM 5
Thermal detections in frame: 3941, high confidence: 127, FRP 37040 MW
Worst modelled AQI in frame: 191 (Tidak sehat), PM2.5 163.4 ug/m3
Modelled surface wind toward northwest, 4.6 m/s
Settlement centers in frame (not an impact list): Langsa, Meulaboh, Subulussalam, Banjar, Denpasar, Klungkung, Negara, Singaraja
Detections by province: Papua Selatan 995, Kalimantan Tengah 549, Kalimantan Timur 262, Kalimantan Barat 262, Sulawesi Tengah 259

AI narrative

Assembled by code from data because Muse Spark was unavailable; not an official warning.

What the map shows
The frame contains 3941 satellite thermal detections, of which 127 are high confidence. These are detections, not confirmed fires.
Where smoke may travel
Modelled surface wind near the frame center blows toward northwest at 4.6 m/s. Smoke higher up may travel differently.
What is uncertain
The worst modelled AQI point in the frame is 191 (Tidak sehat). This is a model grid value, not a station measurement, and transparent areas are not proof of clean air.
What to do next
Compare another timeline frame, then follow official guidance from BMKG, PVMBG and the local disaster agency. For emergencies call 112. This is not an official warning.

Limitations

- The image is a map render, not a photograph of conditions on the ground.
- Transparent areas are not proof of clean air.
- Cloud cover can hide thermal detections.
- No evacuation instruction and no medical advice is given here.

Data sources

NASA FIRMS (thermal detections), NOAA GFS (wind), Open-Meteo / CAMS (air quality model), PVMBG MAGMA (volcano status), Esri (basemap).
