SIAGA.ID Map snapshot report - not an official warning

Figures computed by code

Captured 2026-11-05 05:40 WIB (UTC+7)
BBOX 93.4277,-9.1455 -> 142.5586,4.7845 ZOOM 5
Thermal detections in frame: 5891, high confidence: 126, FRP 42788 MW
Worst modelled AQI in frame: 176 (Unhealthy), PM2.5 124.8 ug/m3
Modelled surface wind toward north, 4.4 m/s
Settlement centers in frame (not an impact list): Langsa, Meulaboh, Subulussalam, Banjar, Denpasar, Klungkung, Negara, Singaraja
Detections by province: Papua Selatan 1407, Kalimantan Tengah 1260, Kalimantan Barat 502, Sulawesi Tengah 464, Kalimantan Timur 406

AI narrative

Assembled by code from data because Muse Spark was unavailable; not an official warning.

What the map shows
The frame contains 5891 satellite thermal detections, of which 126 are high confidence. These are detections, not confirmed fires.
Where smoke may travel
Modelled surface wind near the frame center blows toward north at 4.4 m/s. Smoke higher up may travel differently.
What is uncertain
The worst modelled AQI point in the frame is 176 (Unhealthy). This is a model grid value, not a station measurement, and transparent areas are not proof of clean air.
What to do next
Compare another timeline frame, then follow official guidance from BMKG, PVMBG and the local disaster agency. For emergencies call 112. This is not an official warning.

Limitations

- The image is a map render, not a photograph of conditions on the ground.
- Transparent areas are not proof of clean air.
- Cloud cover can hide thermal detections.
- No evacuation instruction and no medical advice is given here.

Data sources

NASA FIRMS (thermal detections), NOAA GFS (wind), Open-Meteo / CAMS (air quality model), PVMBG MAGMA (volcano status), Esri (basemap).
